

CODING STANDARDS

General

1. All variables should be properly scoped and variable calls should reference said scope (e.g. arguments.firstname or request.user_id)
2. All code should be contained within functions
3. Pass all variables into your functions—don't rely on global variables being available when a function needs it.
4. Code should be efficient but not overcomplicated
5. Use functions to break up processes into practical methods
6. Keep readability in mind when coding and commenting—again, avoid overly complex code, instead, utilize your coding expertise to make code processes obvious and readable
7. No queries or loops on client side pages/templates (e.g. the output). Do your processing within the CFC and create a clean "method" that can be invoked
8. Use Script notation within CFC's and tag notation on client side pages
